

Exercise 5

Tian Xiaoyang
26001904581

The square class is used to define or create a square shape. Since the shape will be a square, all 4 sides of the shape share the same length, so the variable will be “sideLength”. And similarly, the class should have a “get” method for side length, a “set” method and an “area” method. A polymorphic variable is the class diagram is “Shape”.
